

ADR 002 - Rework license handling

Status	PROPOSED
Date	Jan 14, 2026
Deciders	@David Weiss , @Blumenstock, Werner (DI FA DSP SEN TRS) , @Thomas Weinschenk , @Konrad Heidrich , @Christian Franz
Consulted	Michael Heller
Informed	

Context and Problem Statement

The *License* and *License Text* resources support compliance with (open-source) software licenses. However, they provide little added value for actual processing on the edge device.

Additionally, license texts are often very large, quickly reaching message size limits, which complicates license handling.

Since licenses are static and only change when the service is updated (e.g., a new image version), queries always return the same results.

Decision Drivers

- Simplify Edge compliance

Decision Outcome/ Chosen Option

Licenses and license texts shall no longer be transmitted as resources but to use a dedicated mount path (`/opt/oi4/licenses`) instead.

Licenses will be stored there as part of an SBOM (SPDX or CycloneDX). The license texts must either be part of the SBOM or be placed in the license folder as well. Furthermore, they must be clearly assignable to the corresponding licenses.

The responsibility for the SBOM lies with the service provider.

All this information is application related and therefore stored in [6.1.4 Application Specific Storages](#).

With this change, the *License* and *License Text* resources can be omitted.

Consequences/ Pros and Cons

- ✓ Removed resources that have no business value (just for compliance)
- ✓ Simplified Edge compliance
- ✓ SBOM creation can be part of the build process of the image (static) and is state of the art
- ✓ SBOM improves the CRA compliance
- ✓ Endpoint 9.3.15 Software Bill of Material (SBoM) is obsolete as well
- ✗ Con - Breaking change
